IMPACTS ON REAL-WORLD SYSTEMS

- Optimizing Reward Mechanisms for Instagram to Incentivize Content Generation

To incentivize content creators on Instagram to create desirable content distribution that better serves varied Instagram user populations, my PhD student Fan Yao and I successfully live-tested our mechanism on 3% of Instagram traffic (with about 10 millions of active users). Our new mechanism achieved 1.13% percent improvement for the standard industrial metric of user *like-through-rate* (LTR), i.e., the probability that a user will click the content's "like" button after reading it (for comparison, among launched algorithms, a 1% LTR improvement is considered top-performance). Additionally, our algorithm also consistently and robustly leads to improvement on other aspects such as consumption diversity and daily active users. More disclosable details are reported in our KDD'24 papers.

- **Software Assistant for the US Federal Air Marshal Service (FAMS)**

To mitigate the harm due to potential insider threat or real-time surveillance, I developed a new algorithm that enhances unpredictability in FAMS scheduling. This algorithm was integrated into the software that has been successfully delivered to FAMS by [Avata Intelligence](#).

- **PAWS (Protection Assistant for Wildlife Security)**

I have developed a novel algorithm that provides optimal randomized patrol plans against poachers whose behavior is captured via complex machine learning models. My algorithm has been integrated into PAWS, an anti-poaching software system that are in use by hundreds of national parks.
